

Pool GL aur Mirror GL — Complete Concept with Banking DMT Example

1. Pool GL kya hota hai?

- Pool GL ek **temporary account** hota hai jahan **same type ke multiple transactions** collect kiye jaate hain.
- Yeh transactions directly final accounts mein nahi jaate, balki pehle Pool GL mein jama hote hain.
- Iska main purpose hai **paise ko ek jagah temporarily hold karna** taaki aage processing, validation, ya settlement ho sake.

Example:

Customer ne apne local agent ko ₹5000 diya DMT ke liye. Bank ke system mein ye ₹5000 pehle Pool GL mein aata hai — jahan sab agents ke transactions ek saath collect hote hain.

2. Mirror GL kya hota hai?

- Mirror GL ek **reflection ya copy** hota hai Pool GL ka, lekin ye doosre system, branch, ya module mein hota hai.
 - Iska kaam hai **do alag systems ke beech reconciliation (matching) karna** taaki dono systems ke accounts mil sakein.
 - Mirror GL generally Pool GL ke **transactions ko opposite entry ke roop mein dikhata hai** — jisse dono taraf balance match ho jaata hai.
-

3. + aur – (Credit/Debit) Mirror GL mein kyu hote hain?

- Bank ke core system (Pool GL) mein jab paisa aata hai, to wo **credit (+)** hota hai.
- Dusre system (jaise DMT provider) ke Mirror GL mein wo paisa **debit (-)** hota hai.

- Yeh isliye hota hai kyunki ek system mein paisa aa raha hota hai (credit), aur doosre mein paisa ja raha hota hai (debit) — dono opposite entries hain.

4. DMT (Domestic Money Transfer) example with flow

Step	Process Description	Pool GL Entry	Mirror GL Entry
1	Customer pays ₹5000 to agent for DMT	—	—
2	Bank core system Pool GL me ₹5000 credit (+) hota hai	₹5000 credited	—
3	DMT provider system Mirror GL me ₹5000 debit (-) hota hai	—	₹5000 debited
4	Paisa final beneficiary account me transfer hota hai	Pool GL se debit hota hai (paise ja rahe hain)	Mirror GL me credit hota hai (paise receive hue)

5. Why is this important?

- Yeh system helps banks aur payment providers ko **transactions ko track karne, verify karne, aur settle karne** mein help karta hai.
 - Agar Pool GL aur Mirror GL balance nahi karte, to reconciliation fail ho jaati hai, jiska matlab hai koi transaction missing ya mismatch hai.
-

Summary in Simple Words:

- **Pool GL:** Jahan sab incoming paisa temporary store hota hai.
- **Mirror GL:** Doosre system mein us Pool GL ka copy hota hai, jo transactions ko opposite side mein dikhata hai taaki dono systems match kar saken.
- **+ aur – difference:** Ek system mein paisa aa raha hai (credit), doosre mein ja raha hai (debit).
